Dear Ron,

Blood Test Results Letter

Haemoglobin: 118 g/L (reference range 115-165 g/L)

Your haemoglobin level is slightly low. Haemoglobin is a protein in your red blood cells that carries oxygen to the rest of your body. A lower than normal level can be due to a lack of red blood cells, or anaemia. There are many possible causes for anaemia, including poor diet, blood loss, or underlying medical conditions.

If you are experiencing symptoms such as tiredness, shortness of breath, or pale skin, it is important to discuss these with your doctor. They may recommend further tests or treatment to help improve your haemoglobin level and alleviate any related symptoms.

Please note that this result does not necessarily mean you have a serious medical condition, but it is important to follow up with your doctor to determine the cause of your low haemoglobin level and develop a plan to address it.

Sincerely,

Farhan
